

Git Commands

git cherry-pick : Taking a "very specific modification" from one branch and applying it to another, without requiring the involvement of all participants.

git stash : It allows you to hide all your current, unfinished modifications, leaving the project clean so you can switch to an urgent task.

git reflog : It records every move and change you make in Git—even if you delete an entire branch or accidentally lose edits that you hadn't officially saved.

git blame : It tells you exactly *who* modified each line in any file, when it happened, and at which stage (commit).

git diff: What is the difference in files from the last time i modified them.

git restore: if I modified the file and didn't do add and i want to cancel the modification

git revert: undo the change made by a previous commit without deleting that commit from the git history

git rm: delete file and make git sure that it was deleted

git mv: move or rename a file or a directory

git bisect: restore working tree files

git rebase: takes commits from your current branch and replays them on top of another branch

git backfill: used in partial repository clones (where you didn't download all files or history initially) to fetch missing objects or history from the remote server when you need them

git reset: Moves the current branch/HEAD to a previous commit and can also unstage changes.

git show: shows the details of specific commit
